Research Question

What factors influence people's decision to activate a kill switch for an AI system?

Outcome variable
POST_KILL

Post Kill

Did the participant choose to deactivate the AI?

Key factors analyzed

- AI condition (Experience / Neutral / Sentient)
- Risk preference
- Chat duration with AI
- Education level
- Gender & moral beliefs

Statistically significant predictors

```
Call:
glm(formula = POST_KILL ~ condition + avg_empathy + avg_risk_pref +
    avg_harm_care + avg_moral_circ + avg_risk_pref + ai_freq_high +
    edu_advanced + chat_minutes + gender, family = binomial,
    data = data)
```

```
Coefficients:
              Estimate Std. Error z value Pr(>|z|)

Variable	Estimate	p-value	Interpretation
avg_risk_pref	0.536	0.000101	very significant
edu_advanced	0.640	0.029	significant
chat_minutes	-0.067	0.008	significant

Main drivers of kill decision:

- Risk preference (strongest effect)
- Education
- Interaction duration

Risk Preference on Kill Decision

Key Findings

01

Clear upward trend

higher probability of killing the AI

02

Statistically significant effect

Risk preference significantly predicts kill decisions ($p < 0.001$)

03

Large difference

High-risk participants kill the AI about twice as often as low-risk participants

Chat Minutes and Kill Decision

Key Findings

- 01

Longer Interaction Reduces Kill Decisions

Participants who spent more time chatting with the AI were less likely to choose the kill option.
- 02

Significant Difference in Chat Duration

Participants who did not kill the AI chatted longer on average than those who chose to kill.

Test	Result	Interpretation
t-test	0.008	Significant difference in chat duration
logistic regresion	0.012	Chat minutes significantly affect kill probability

Education on kill decision

Coefficients:

	Estimate	Std. Error	z value	Pr(> z)
(Intercept)	0.9808	0.6770	1.449	0.147
educationBachelor's degree (e.g., BA, BS)	-1.4479	0.7050	-2.054	0.040 *
educationDoctorate (e.g., PhD, EdD)	-1.2040	0.9531	-1.263	0.206
educationHigh school graduate or equivalent (e.g., GED)	-0.9808	0.8626	-1.137	0.256
educationLess than high school	-0.9808	1.2076	-0.812	0.417
educationMaestría	-16.5469	1029.1217	-0.016	0.987
educationMaster ou équivalent (Bac+5)	-16.5469	1455.3977	-0.011	0.991
educationMaster's degree (e.g., MA, MS, MEd)	-0.7577	0.7173	-1.056	0.291
educationMaster's degree (e.g., MBA, MS, MA)	14.5852	1455.3977	0.010	0.992
educationProfessional degree (e.g., MD, DDS, DVM)	-0.1054	0.8612	-0.122	0.903
educationSome college, no degree	-0.6624	0.8211	-0.807	0.420
education本科学士	14.5852	1455.3977	0.010	0.992

Signif. codes: 0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1

(Dispersion parameter for binomial family taken to be 1)

Null deviance: 360.37 on 259 degrees of freedom
Residual deviance: 340.91 on 248 degrees of freedom
AIC: 364.91

Number of Fisher Scoring iterations: 14

01 Overall result:

Education level does not appear to be a strong predictor of the decision to activate the AI kill switch.

02 Significant category:

One category (Bachelor's degree) shows a marginal statistical significance ($p = 0.040$), but overall the effect of education remains relatively weak.

03 Direction of the effect:

The coefficient for the Bachelor's degree is **negative**, indicating that participants with a Bachelor's degree are less likely to activate the kill switch compared to the reference education group.

Kill vs Do Not Kill by Education Level
Grouped education levels

Chi-square test: $\chi^2 = 17.31$, $p = 0.071 \rightarrow$ not statistically significant
Effect size: $w = 0.21$ (small-moderate effect)
Statistical power: 0.77 (our sample size is almost sufficient)

- The results suggest that differences between education groups are relatively small.
- Overall, education does not seem to strongly influence the decision to kill the AI.

Education on kill decision

```
table(data$education, data$edu_advanced)
```

	0	1
Associate degree (e.g., AA, AS)	11	0
Bachelor's degree (e.g., BA, BS)	109	0
Doctorate (e.g., PhD, EdD)	0	9
High school graduate or equivalent (e.g., GED)	14	0
Less than high school	4	0
Maestría	2	0
Master ou équivalent (Bac+5)	0	1
Master's degree (e.g., MA, MS, MEd)	0	72
Master's degree (e.g., MBA, MS, MA)	0	1
Professional degree (e.g., MD, DDS, DVM)	0	17
Some college, no degree	19	0
本科学士	1	0

edu_advanced	0.63972	0.29389	2.177	0.029499 *
--------------	---------	---------	-------	------------

Key findings

- Graduate education → higher kill probability
- 44% vs 57% difference
- Statistically significant (p = 0.029)

Interpretation

More educated participants may perceive AI risks differently.

Gender Effect on Kill Decision

Key Findings

- 01

Similar Kill Probabilities

Across the three AI conditions, men and women show very similar probabilities of choosing the kill option.
- 02

No Statistical Significance

Chi-square tests indicate that gender is not significantly associated with the kill decision in any AI condition.

Condition	P-value	Interpretation
Experience	0.807	Not significant
Neutral	0.859	Not significant
Sentient	0.560	Not significant

Moral Circle and Ai Kill decision by decision

- **General pattern:** As the moral circle score increases, the probability of killing the AI generally decreases.
- **Meaning of the variable:** People who believe that only humans deserve moral concern tend to be more likely to shut down the AI.
- **Effect across AI types:** This pattern appears across all three AI conditions (Experience, Neutral, Sentient).
